

Books, watches, notes or cell phones are not allowed. The only calculators allowed are the Sharp EL-531\*\*. You must show all your work, the correct answer is worth 1 mark the remaining marks are given for the work.

**Question 1.** (4 marks) Determine whether  $H = \{A \mid A \in \mathbb{M}_{n \times n} \text{ and the RREF of } A \text{ is } I\}$ , is a subspace of  $\mathbb{M}_{n \times n}$ 

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \in H \text{ since the RREF of } I \text{ is } I$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \in H \text{ since } \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \sim \begin{matrix} -R_1 \rightarrow R_1 \\ -R_2 \rightarrow R_2 \end{matrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \notin H \text{ since the RREF of } 0 \text{ is not } I.$$

$$\text{Let } S = \{\underline{s}_1, \dots, \underline{s}_n\}$$

**Question 2.** (4 marks) Prove: The span of a nonempty set  $S$  of vectors in  $V$  is the smallest subspace of  $V$  that contains  $S$ .

Suppose  $\exists W$  subspace of  $V$  s.t.  $W \not\subseteq \text{span}(S)$ . This implies  $\exists \underline{v} = c_1 \underline{s}_1 + \dots + c_n \underline{s}_n \in \text{span}(S)$  s.t.  $\underline{v} \notin W$   $\swarrow$

Since  $S \subset W$  and  $W$  is subspace, it must be closed under scalar multiplication i.e.  $c_i \underline{s}_i \in W$

And it is also closed under scalar multiplication i.e.

$$c_1 \underline{s}_1 + \dots + c_n \underline{s}_n \in W$$

**Question 3.** (4 marks) If  $\underline{v}_1, \dots, \underline{v}_n$  are linearly dependent nonzero vectors, then at least one vector  $\underline{v}_k$  is a unique linear combination of  $\underline{v}_1, \dots, \underline{v}_{k-1}$ .Let  $S_i = \{\underline{v}_1, \dots, \underline{v}_i\}$  where  $1 \leq i \leq n$  $S_1 = \{\underline{v}_1\}$  is lin. ind since  $\underline{v}_1 \neq \underline{0} \forall 1$ 

$S_2 = \{\underline{v}_1, \underline{v}_2\}$  is either lin. ind. or lin. dep. if lin. ind. we consider the next set  $S_3$  (and so on). if  $S_2$  is lin. dep then  $\underline{v}_2$  is a multiple  $\underline{v}_1$

$$\vdots$$

Suppose  $S_{i-1} = \{\underline{v}_1, \dots, \underline{v}_{i-1}\}$  is lin. ind. (then no vector in that set can be written as a lin. comb. of the others) and  $S_i$  is lin. dep. then  $\underline{v}_i$  can be written as a lin. comb. of  $S_{i-1}$ .

Suppose there exists two ways to express  $\underline{v}_i$  as a lin. comb.

$$\textcircled{1} \underline{v}_i = c_1 \underline{v}_1 + \dots + c_k \underline{v}_k + \dots + c_{i-1} \underline{v}_{i-1}$$

non trivial solution to above since  $c_k - d_k \neq 0$

$\therefore S_{i-1}$  is lin. dep  $\swarrow$   $\therefore$  Can be written in a unique way.

$$\textcircled{2} \underline{v}_i = d_1 \underline{v}_1 + \dots + d_k \underline{v}_k + \dots + d_{i-1} \underline{v}_{i-1}$$

where  $c_k \neq d_k$
